LOGIC MODEL FOR SCALE-UP

PURPOSE

The logic model describes the theory of change leading to the innovation being offered at scale—to the point where the innovation becomes part of routine service delivery—and depicts the causal relationships of inputs, processes (activities and participation), outputs, outcomes and impact. It serves as a guide to achieving project objectives for core resource organization staff and the network of incountry partners who are collectively responsible and accountable for scale-up success as the innovation moves from pilot to being offered at scale. It may also be used as a resource during monitoring and evaluation.

HOW IT WAS DEVELOPED AND USED

IRH developed a global project logic model through a series of consultations amona headquarters and field staff and partners. The global logic model, which uses a standard logical framework (log frame) format with impact defined as increased availability of SDM, was designed to be broad enough to guide all five country scale-up programs. Consultations involved targeted input from USAID and other stakeholders, discussions about what IRH expected to change due to widespread expansion of method choice once Standard Days Method® (SDM) was incorporated, and consideration of the activities that would be needed to make SDM services broadly available and sustainable.

The logic model was derived from a temporal and systems-oriented relational framework of SDM integration, which outlined the project's theory of change. More closely tied to the ExpandNet model of building evidence before considering going to scale, it defines impact as contributing to Millennium Development Goals. We share both the logic model and the relational framework in the compendium but focus discussion in this section on the more traditional logic model that was used to guide country-level efforts.

The logic model was used in discussions with stakeholders in the early stages of scale-up and served as a reference in subsequent years. During the initial scale-up phase it was used to guide key decisions relating to the range of activities on which to focus and identification of partners critical to ensure SDM integration into the method mix of FP programs.

ATTENTION TO VALUES

The global logic model that was first developed did not explicitly lay out the values embedded in the SDM package of interventions or in a scale-up process. Classic log frames are not designed to incorporate values, as they detail activities that can be monitored. They can be adapted to measure values-oriented results, such as 'favorable attitudes to SDM by policymakers.' Additionally, due to the systems-oriented focus of this framework, end-users were not included in the global log frame. The second, in-country log frame did include a more explicit focus on values and users.

LESSONS LEARNED

 Practically, the participatory approach used to develop the log frame yielded better understanding of scale up processes by all partners, specifically, the breakdown of the process section into activities and participation—that is, listing individuals, groups, types of organizations that would be reached with interventions.

- Overlay of causal relationships with specific types of monitoring, learning, and evaluation in the same graphic worked well.
- Conceptually, this log frame did not incorporate a developmental, non-linear process such as scaling up within complex systems. Other model types might be more useful, such as logical frameworks from the practice of Developmental Evaluation, which are designed to be adaptable over time and to reflect the non-linear nature of scaling up within complex health systems.

RELATIONAL FRAMEWORK OF SDM INTEGRATION INTO NATIONAL FP/DEVELOPMENT PROGRAMS

^{*}The ExpandNet terms for scale-up are used for this framework. The arrow between the user and resource organization shows the fluidity between the two; organizations may move from user to resource or activities may switch around between user and resource organization, especially as countries go further along in the process of scale-up. Likewise, various results influence each other and shift throughout the scaling up process.

LOGIC MODEL FOR MONITORING PERFORMANCE AND EVALUATING FAM SCALE-UP AT THE COUNTRY LEVEL

In-Country Program Perspective: What IRH and its network of in-country partners are collectively responsible and accountable for Objective: Reduce unmet need by increasing FAM use

## What we invest does Staff (IRH and partners) • Provide technical assistance • Advocate for integration of FAM into service delivery • IRH • Other Findings • In-country FAM resource organizations • Partners (global and in-country) • Policy Guidelines and procedures • FAM resources • Carderals • Training materials • Iraining of trainers • Training of trainers • Training of trainers • Training of trainers • Training of trainers Mhot is reached • Potential FAM clients • Other FAM • Other FAM • Other FAM • Community • Develop/adapt • Create awareness of fertility and FAM • Community • Community • Develop/adapt • Create awareness of fertility and FAM • Community • Community • Policy Cuidelines • Provide FAM • Short-term changes • Increased awareness of fertility and FAM • FAM integrated into existing FP programs (national surveys, procurement, training programs, supervision systems • Training of trainers • Supplies (ie, CycleBeads and client instructions) Input/Resource	INPUTS	PRO Activities	CESS Participation	0	OUTPUTS/OUTCOMES
